Captopril renography (CRS) with $^{99m}$Tc-DTPA and $^{99m}$Tc-MAG3 was performed on a 21-year-old woman with renovascular hypertension due to right renal artery stenosis caused by fibromuscular dysplasia. In the affected kidney, the renogram pattern was substantially changed with $^{99m}$Tc-DTPA and $^{99m}$Tc-MAG3 following the administration of captopril, and the quantitated renal uptake indicating individual renal function was significantly decreased in $^{99m}$Tc-DTPA and slightly decreased in $^{99m}$Tc-MAG3. In the contralateral normal kidney, the renogram showed some minor changes with both radioagents, while the quantitated renal uptake was significantly decreased with $^{99m}$Tc-DTPA and substantially increased with $^{99m}$Tc-MAG3. The combined use of physiologically different renal agents $^{99m}$Tc-DTPA and $^{99m}$Tc-MAG3 is helpful in investigating hemodynamic and functional changes in the stenosed kidney as well as the normal kidney in RVH.

**Key words:** captopril renography, $^{99m}$Tc-DTPA, $^{99m}$Tc-MAG3, renovascular hypertension, fibromuscular dysplasia
