

## Summary

### The Usefulness of $^{99m}\text{Tc}$ -MIBI Scintigraphy in a Patient with Hyperparathyroidism Who Underwent Percutaneous Ethanol Injection Therapy

Hitoya OHTA

*Department of Radiology, Osaka Red Cross Hospital*

$^{99m}\text{Tc}$ -MIBI scintigraphy was performed in a 67-year-old male with hyperparathyroidism who underwent percutaneous ethanol injection therapy (PEIT). Abnormal  $^{99m}\text{Tc}$ -MIBI uptake was clearly recognized.  $^{99m}\text{Tc}$ -MIBI scintigraphy was useful also in the

evaluation of hyperparathyroidism after imperfect PEIT.

**Key words:** Parathyroid, Scintigraphy,  $^{99m}\text{Tc}$ -MIBI, Percutaneous ethanol injection.
