Left hemiconvulsions occurred in a 13-month-old girl with *Hemophilus influenzae* (*H. influenzae*) central nervous system (CNS) infection. Tc-99m HMPAO brain SPECT showed a focal hyperperfusion area in the right frontal lobe. The patient recovered without complications, and follow-up SPECT revealed markedly improved findings. Tc-99m HMPAO brain SPECT is useful for evaluating focal convulsions associated with *H. influenzae* CNS infection.

Key words: Hemophilus influenzae, Tc-99m HMPAO, SPECT, central nervous system
